## SeaHunterMarkII

The Garrett Sea Hunter Mark II is a microprocessor driven pulse induction submersible that is lightweight, highly durable and very easy to use. It can locate ferrous and non-ferrous metals concealed within and beneath aquatic growth, bottom soil and rocks, wood and other non-metallic materials. Even large items such as boats, motors and safes can be detected several feet deep by the Sea Hunter Mark II.

The Sea Hunter's high performance, custom-designed housing and multiple configurations make it a favorite among crime scene investigators. It boasts superb sensitivity, speedy target response and features an exclusive Discrete Target Elimination mode, in addition to a standard one, which enables it to differentiate between similarly conductive targets more precisely, helping to zero in on target items without digging up a lot of trash.

The Sea Hunter Mark II comes with four handy stem mounts: the long stem with top stem mount, under cuff stem mount, hip mount and the short stem ScubaMate. The long stem enables you to carry the control housing on your waist or shoulder, while the ScubaMate is ideal for searching on land or in shallow water.
